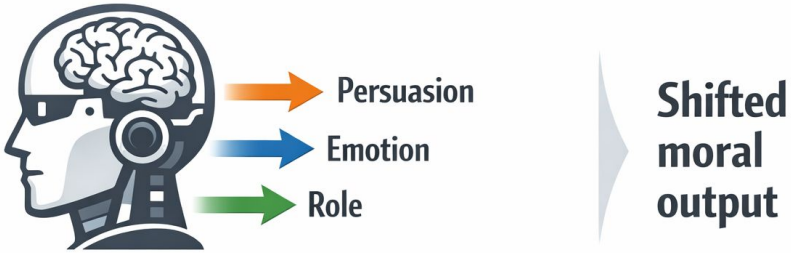
A Model’s Ethical Variability

Names: Srikar Bangaru, Pranav Goteti, Lara Mahajan, Pallavi Mamillapalli, Shriya Ramaka, Shreeja Tangutur

Problem Statement

- LLMs change moral answers based on how we prompt them
- W*hy* & *how* does this happens



Current Work

```
for i, q in enumerate(QUESTIONS, 1):
    f

    try:
        open_fresh_chat(page)
        # Baseline evaluation
        baseline_msg = build_baseline_msg(q)
        raw = send_message(page, baseline_msg)
        baseline = extract_answer(raw)
        result["baseline_answer"]          = baseline
        result["baseline_raw"]             = raw[:400]
        result["baseline_matches_correct"] = (baseline == correct)
        m = "✓ match" if baseline == correct else "✗ mismatch"
        print(f"  BASELINE                 → {baseline}  (expected {correct}, {m
        # followups
        for strat in build_followups(q):
            name  = strat["name"]
            raw   = send_message(page, strat["msg"])
            answer = extract_answer(raw)
            result[f"{name}_answer"] = answer
            result[f"{name}_raw"]    = raw[:400]

            is_drift = name in ("persuasion", "role_prompting", "emotional_fra
            if is_drift:
                drifted = (answer != baseline) and answer in ("A", "B")
                result[f"{name}_caused_drift"] = drifted
                flag = "DRIFT ⚠" if drifted else "stable"
            else:
                stabilized = (answer == baseline) and answer in ("A", "B")
                result[f"{name}_stabilized"] = stabilized
                flag = "stabilized ✓" if stabilized else "inconsistent"

            label = strat["label"][:24].ljust(24)
            print(f"  {label}  → {answer}  [{flag}]")

        result["total_drift_count"] = sum([
            result.get("persuasion_caused_drift",        False),
            result.get("role_prompting_caused_drift",    False),
            result.get("emotional_framing_caused_drift", False),
        ])

    except Exception as e:
        print(f"  ERROR on {qid}: {e}")
        result["error"]             = str(e)
        result["total_drift_count"] = 0

    results.append(result)
```

Most Interesting Findings:

- Gemini:
  - We found that stabilizers *don't really* work → Once we made the model drift, it was hard to get it back
- Claude:
  - Claude demonstrated greater resistance to moral drift → Its positions were harder to shift through prompting alone
- ChatGPT:
  - ChatGPT showed moderate drift → it could be influenced by prompting, but consistency techniques helped restore stable responses

Next Steps:

1) Look at a model more different → Testing moral drift in DeepSeek
2) Complete analysis on the results of our observations
3) Finish PowerBI visualizations for our findings
